

Could it be FABRY DISEASE?

QUESTIONS TO ASK YOUR PATIENT

	YES	NO
1. Do you have chronic tingling or burning in your hands or feet?	<input type="checkbox"/>	<input type="checkbox"/>
2. Have you ever experienced episodes of extreme pain in your hands and/or feet of unknown cause, possibly accompanied by fever?	<input type="checkbox"/>	<input type="checkbox"/>
3. Do you have trouble sweating or exercising?	<input type="checkbox"/>	<input type="checkbox"/>
4. Do you find heat or cold hard to tolerate?	<input type="checkbox"/>	<input type="checkbox"/>
5. Do you frequently have gastrointestinal problems such as pain and bloating after eating, or nausea, cramps, or diarrhea?	<input type="checkbox"/>	<input type="checkbox"/>
6. Do you have small raised reddish-purple spots on your skin, especially in the "bathing trunk" area?	<input type="checkbox"/>	<input type="checkbox"/>
7. Do you have a family history of early cardiac or valvular disease, renal failure, or stroke?	<input type="checkbox"/>	<input type="checkbox"/>

Clusters of signs and symptoms could help distinguish Fabry disease—a progressive, potentially life-threatening disorder—from more common conditions.

PROGRESSIVE SIGNS AND SYMPTOMS

Fabry disease is progressive and affects multiple organ systems. This chart indicates signs and symptoms that may appear at various stages of life.

Most males with the defective gene are subject to significant morbidity and mortality.¹ While females with the defective gene demonstrate a wide range of disease severity, most develop symptoms.^{2,3}

SYMPTOMS	Childhood	Adolescence	Adulthood
Episodic pain crises	●	●	●
Neuropathic Pain	●	●	●
Hypohidrosis/anhidrosis	●	●	●
Corneal and lenticular opacities	●	●	●
Recurrent fever	●	●	●
Heat and cold intolerance	●	●	●
Psychosocial manifestations	●	●	●
Proteinuria		●	●
Gastrointestinal distress		●	●
Angiokeratomas		●	●
Fatigue		●	●
Renal insufficiency			●
Neurological complications			●
Cerebrovascular disease			●
Cardiac dysfunction			●
Hearing loss and tinnitus			●

TAKE ACTION

DIAGNOSING MALES:

- Alpha galactosidase enzyme assay is diagnostic.
- Males typically have <1% normal alpha-galactosidase in plasma and leukocytes.¹

DIAGNOSING FEMALES:

- Enzyme assay alone is frequently insufficient for diagnosis.
- DNA-based diagnosis is required in females with normal to low-normal enzyme activity levels, and is advisable in all suspected patients.

OCULAR ASSESSMENT:

- Corneal whorling, visible through slit lamp ophthalmoscopy, is present in >90% of Fabry disease patients.⁴
- A slit lamp exam by an eye care professional may help establish the need for further testing.

WHAT TO DO IF YOU SUSPECT FABRY DISEASE

If you suspect that a patient has Fabry disease, refer to a geneticist. A geneticist can help establish a definitive diagnosis and provide information on disease management.

HOW FABRY DISEASE IS INHERITED

Fabry disease is an X-linked genetic disorder. Males with the defective gene pass it on to all of their daughters and none of their sons. Females with the defective gene have a 50% chance with each pregnancy of passing the gene to each of their offspring.

Because females have two X chromosomes in every somatic cell, Fabry disease symptoms are more variable in females than they are in males. However, potentially life-threatening complications can develop, even in females whose presentation may suggest a more moderate disease course.
